If it is possible, could we have photographs? And then the other one. So you also want to find a way of entering information, of course, here. You don't want to start from scratch, yeah? It's possible, but no, just this here.

Just this here? Okay. Uh-huh. Okay, number of leaves.

We have talked about the number of total leaves. We have our field. We enter it every month.

I will not try to put constraints because you haven't... You have a particular date you go to and be like 28th. That's when we check the report and we say. The number of sick days.

So now, like today. Today is 29th. Tomorrow we will be checking.

Okay. But usually this is it. I wanted to show you.

This guy has even applied for his leave. It's going to be rejected. So usually, like now this one, we have two applications.

And then we also have these ones. Okay. So even in total, like for example... I see even there's this single application.

So you can see that maybe if you had like 68 in total. But this is for since January. Since January.

68 in total. And then you divide by now the number of staff, 505. So you get this figure.

The total number of days which every person will have taken. Okay. So we can get the next one.

So I've talked about taking health test for each. So that we know... Can you send me that document? Okay, I'm going to send it to you. Then this is ergonomics.

Ergonomics, ergonomics about what? So ergonomics, basically just for example, this guy is working here. So we want to make sure that even as he's doing his work, he's not strained or constrained in performing. In other words, making work easier.

So you know, you guys, what helps you to interact with your computer very well. Maybe you need to put on glasses. Yes.

Maybe a sitting posture so that you don't end up with a back problem. Yes. Maybe a table which is raised, a chair which is raised.

Okay. So those are the things that we look at in ergonomics. What do you record in ergonomics? Because I haven't seen anything that you can record.

You haven't seen anything? Yes. Assessments. So the number of assessments.

The number of assessments you have done, ergonomic assessments, because it's more of a risk assessment. So you are going to go there. When you are recording, you record the number of assessments you have done that you are going to trim here, here, here.

Then out of those assessments, you can be able to have maybe, for example, maybe like three outcomes. Which one of the outcomes will be ergonomically fit for someone? Maybe another one will be unfit ergonomically assessment to show that maybe the ergonomic settings aren't fit for someone. Compliant or not compliant? Compliant, another one.

Non-compliant, another one. Partially. Partially, partial compliance.

Compliant. Non-compliant. Non-compliant.

So you go by individual passes. A station, right? A station. Yeah, it may be more of like a... You may go to the other office for charges.

Enter there, you see. So you do the assessment. So for example, okay, you have... An assessment.

Do you have anything that you... Okay, I have... A tool. Yes. Aha, now.

Same thing I was asking about today, that you don't have a tool, that assessment tool. But it is going to be found, station by station. For now, we cannot get to the details of whatever we are assessing, but we may only have the outcomes.

Let's just have the outcomes. Because now, every station is going to have its own compliance status. So for example, me, if I'm supposed to be here, maybe I need a chair with a headrest.

Now when you look at my place here, I have a table, I have a seat, but I don't have batteries. Maybe my chair is too low. When I'm interacting with the computer, I'm forced to bend.

So we can have the three, compliant, non-compliant, partially compliant. Partially compliant. Then, operational exporter monitoring.

So, my friend. The air quality. You record it, how do you measure it? The air quality.

The air quality. Now, for the case of the air, that's why we have the parturage meter now. We have the parameters on the parturage meter, PM10 and PM2.5. So you have your fields that you are going to be recording, right? Yeah.

PM10 and PM2.5, right? Are we only looking at PM2.5? It doesn't matter, until now it depends. There are some areas which have hooks. Right here we can compare it.

So we can talk about PM, PM10, PM2.5, sulphur dioxide. We can talk about carbon dioxide. But this table didn't come.

I don't even know what has happened here with the table. Has it just happened? Because I've seen, I had separated the table. No, the table was merged.

By the way, which best AI do you use? How good is Cloud? Cloud is good for coding. But I would recommend to use Chachipiti for general use. If you are not going to code.

What do you mean by coding? Coding is like coming up with websites, what and what. Maybe when you take a survey. But Chachipiti can do it also.

And it has other features. So like image generation. You can generate as many images as you want.

It's better when it's creating. It slides. It's very good on normal to day use.

For Cloud, it's very specialized that IT people. There are a lot of things that we are facing. Maybe I'm dealing with a very large code base.

I'm just new to a job. But they have given enough system for their system. So Cloud is going to help me read through that system.

If they tell me, do this. I'm not going to take time to read through all those programs. You can just search through and be like, okay.

What you need to add is here. And even give me a plan and everything. So it's good for our... Is it the one that you probably could use? Probably to arrange files within your computer? Because now... Chachipiti can do it also.

Chachipiti can also do it. Ah, which one? The enhanced, the pro version. Yeah.

You have to arrange files. Also for Cloud to do those coding, you have to pay. And for Cloud, since it's very good in coding and everything.

It has a limit tokens. You can be using it and it gets done. You to pay doesn't mean that you're going to use forever.

But it just gives you a larger thing. But for Chachipiti, use forever. So, I feel like if you're in day-to-day things and you need to do slides.

You need to create documents. Maybe you need to create a report here. You also need to... How about you? How good is Gemini? Gemini... It's just there in the middle.

It's not good at anything. And it just tries to balance everything and it's failing. I don't understand

why my one table... But it's okay.

This is this table. It's the table we've been raising. Something has come in the middle.

And then it's the same table up. Hey, friends. I have just undone that thing.

Hey. Here, sorry. Use domain.

Like that, eh? Okay. Like that? No, nothing. Wait, there's something in the middle of that table that's not supposed to be.

This one here. Let's continue. Control one.

I think it was there before. No, this was the first table. The other one I just added it.

Are you seeing? Okay, sorry. Control Z. And it's supposed to be under this. Air quality monitoring.

Under? Air quality. Like this, eh? Mm-hmm. So, the other table which I have deleted... So, the other table has the... It's supposed to be under air quality.

But it's okay. I put it here. Yeah, some of this... Actually, it contains.

But then, the thing I'm trying to show here is the thing of overall air quality. This one here. So, there are no more standards.

I was trying to make the thing that maybe this is the target. Okay. Do you calculate it yourself? So, we want to sum up after looking at all these parameters here.

Yeah. After looking at these parameters, we want to average by the number of the things. Then we come to the compliance status.

Okay, I think you gave me the exact what? So, for example, this is the target. When we do this, we expect in 24 hours to meet this target. This is the standard that has been set as normal.

Yeah. So, when we get something outside, that means we are not compliant. So, we can maybe put here X for something which is not compliant.

You put like something X, I think. Yeah. Since you are going to send me that document.

Yes. Okay. So, air quality.

What's this? What's next? So, what's next? I think for me, I have mainly... So, you can send me those two forms. Those two documents. Then they come up with the requirements document.

The specification. Then they start rating it. NMDP, so that you can maybe when you are presenting and show, asking for service rate or something, you can show it.

You go to shapes. Shapes or symbols. If you have symbols, you can go to symbols.

I think mine doesn't show that. You just go to X. To pointers and you just put that up. Like a pointer with a T. So, you have to put that again.

Occupation hazard. That's all. That's all.

So, what we ask. Because we are basically, just for us, we started our unit. Our division is from zero.

We are just developing it. So, meaning that it's even possible that we might have more improvements to make. So, hopefully, whatever we make out of this, it will be possible in the future to also maybe make some additions and improve.

For sure, we know that there will be some additions to make. You said I go to pointers. Yeah.

You first close it and go to... Go to pointers. Yeah. Down arrow here.

No, no, no. This one. The next one.

The one next to it. Just put that up. You put it here in a blank space.

Delete. Yeah. Here.

At games and at games. Okay. Okay.

Yeah. And here, your state X. Okay. So... No, no, no.

The same. So, this is a rough one. In case you need any, you can always text me.

I can do it for you. Yeah. You can send it to the clients.

I extract them so that it shows what is required, what needs to be recorded. Nice. Maybe on Friday, I will have something for you guys.

I'm not sure. So... You guys are leaving, right? We are leaving.
